

AdBIS – Banking information system

AdBIS is a comprehensive banking information system supporting transactions of natural and legal entities. This solution has been tested to support all data flows in banking transactions. A modern structure and advanced technologies used provide a bank with a series of technical and, even more importantly, business advantages.

Advanced and Flexible System

Banking operations are based on the optimal use of information available and the effective work of employees. Being an adaptable and expandable system, *AdBIS* allows the bank to set up an IT system that meets the requirements of banks' users. They can work more effectively, increase the value created and reduce operating costs.

- **Adaptable model of products and services**

Banks often face the need to change the existing, and introduce new, operations in order to meet the changing legal requirements or e.g. ownership structure. The *AdBIS* system has been designed based on the latest banking products that are supported by well-thought implementation of standard operation procedures. A new product only needs to be properly defined in order to be introduced, since the required operating procedures have already been set up. In this way the time needed and the costs of introducing new banking products and services are considerably reduced.

- **Due to its modular and expandable design, the solution is a long-term asset**

As a comprehensive banking system *AdBIS* represents a long-term investment of the bank. The required modules of the *AdBIS* system can be dynamically selected and the bank is able to effectively take advantage of its new options. New technologies provide compatibility with the existing banking software solutions and other final programme modules in the market, thereby reducing software-purchasing costs on a long-term basis.

- **High level of security**

Providing controlled and limited access to information is vital in any banking environment. *AdBIS* allows banks to precisely determine and limit access levels to individual users, while at the same time monitoring all the events taking place in the system. Possibilities for security policy breaches are substantially reduced. Further, the actual responsibility can be tracked down in any case of breach.

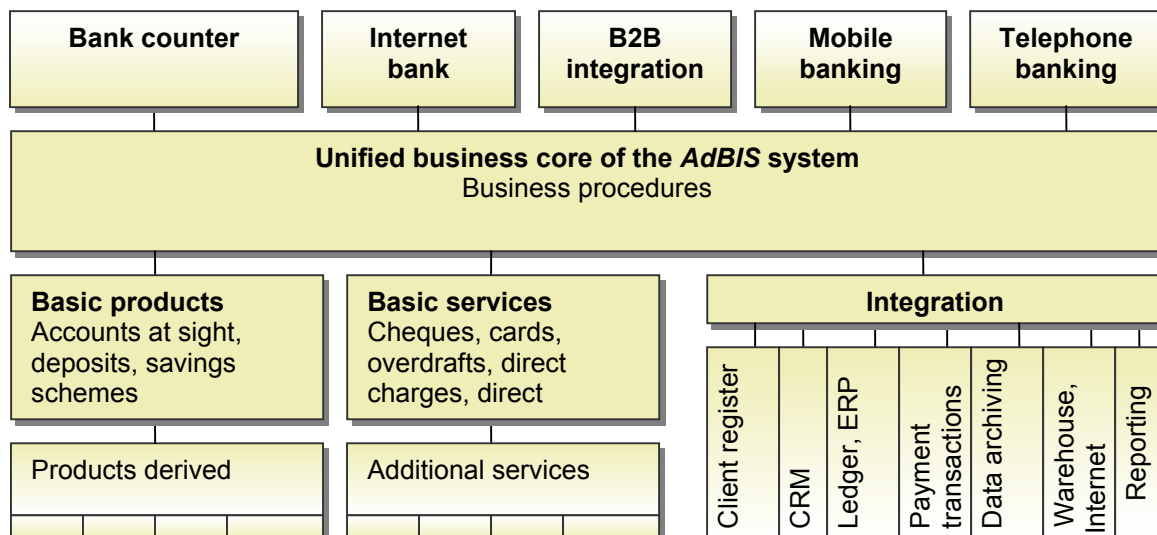

Internal bank users will find the application easy to use; this will increase their satisfaction and reduce costs

AdBIS is distinguished with its intuitive and user-friendly interfaces, which enables the reduction of initial training for the users as well as the time required for the introduction of the system. The modern architectural solution with clients, taking into consideration the geographical dispersion facilitate the technical introduction of new software in existing locations and increase the system's responsiveness and availability.

Complete System Integration

The central core of the *AdBIS* system is the unifying point of all procedures in the banking environment. All system expansions or external modules can be linked to this unifying point:

- **Basic and expanded modules of the *AdBIS* system**
All existing modules of the *AdBIS* system for the support of products and services:
- **Systems supporting marketing channels**
AdBIS already supports all the existing marketing channels from a counter to Internet and mobile banking. At any time new support systems can be added if required.
- **External applications**
AdBIS is an ideal basic system for the upgrade with data stores and other systems, such as CRM, Management IS, and risk management system or e.g. ERP systems.

Fast implementation and the possibility of gradual introduction of new system

AdBIS and its modular concept enable fast and flexible introduction of the new system. The bank has a possibility to establish only parts of the functionality that meet the present requirements. At a later stage other parts can be added in accordance with its own development. In this way the bank can introduce a cost-effective and optimal system that meets its complete needs. Consequently the project introducing the *AdBIS* system substantially increases efficiency because:

- **Better costs and time** control of the project are ensured:
Short-term and small, well-defined segments of the project are easily controlled and results of the implemented projects are easily measurable which is of vital importance for the evaluation.
- **Results of introducing the *AdBIS* system are quickly visible** to users and all other partners included:
Since the first results of the *AdBIS* introduction can be quickly visible to clients and investors, the level of the project support and support to the *AdBIS* system in the bank can be increased.

The tested solution assures investment safety

AdBIS has been developed in co-operation with top banking experts. A top technical team has integrated a good concept with advanced contents into a comprehensive solution. Users of our banking solutions, both with which *AdBIS* has been introduced as a corporate system and only as individual modules, have substantially increased efficiency of operation over the many years of experience; subsequently new products and services have been introduced as type solutions. In a critical period of a payment transaction reform and other legal changes the system has proved to be extremely flexible.

Besides that AdBIS is also distinguished by very low total costs of ownership (TCO), which additionally increases the system value.
